

BUG-001: Trips API returns empty list → booking unavailable

Title:

Trips API returns empty response → no routes available for booking

Environment:

Staging: <https://acp-front-nu.vercel.app>

API: <https://acp-api-w2ng.onrender.com>

Browser: Chrome 146.0.7680.165

Date: 03.04.2026

Preconditions:

User opens homepage

Application successfully loads

API requests are sent to backend

Steps to reproduce:

Open homepage

Open DevTools → Network

Filter by Fetch/XHR

Find request: /api/v1/trips

Open Response / Preview

Check returned data

Try to select route on UI

Actual result:

/trips request returns 200 OK

Response body is empty array ([])

UI displays message: "Наразі немає доступних маршрутів"

Route dropdown is disabled

Time dropdown is disabled

User cannot proceed with booking

Expected result:

/trips should return list of available routes

UI should display routes in dropdown

User should be able to select route and time

Booking flow should be available

Priority:High

Severity:

Critical (core business flow is blocked)

Notes:

No 500 errors observed

API responds successfully but without data

Issue may be caused by:

missing test data on backend

incorrect filtering logic

environment misconfiguration

BUG-002: Incorrect error message when Trips API fails

Title:

Incorrect error message displayed when Trips API request fails

Environment:

Frontend: <https://acp-front-nu.vercel.app>

API: <https://acp-api-w2ng.onrender.com>

Browser: Chrome 146.0.7680.165

Date: 05.04.2026

Preconditions:

User opens the homepage

Application loads successfully

Steps to reproduce:

1. Open the website
2. Open DevTools (F12)
3. Go to Network tab
4. Find request to /api/v1/trips or /users/profile
5. Right-click on request → Block request URL
6. Refresh the page

Actual result:

When API request fails (blocked), UI displays message:

"Наразі немає доступних маршрутів" (No routes available)

This message is misleading because the issue is caused by API failure, not absence of data.

Expected result:

User should see an appropriate error message indicating a server or network issue (e.g.

"Failed to load data", "Server error", etc.)

UI should clearly communicate that data could not be loaded due to an error.

Priority: High

Severity: Medium

Attachments:

Screenshots showing:

- Blocked request in Network tab
- UI displaying incorrect message.

BUG-003: Header overlaps content when scrolling

Title:

Header overlaps page content during scroll, causing layout shift and blocking UI elements

Environment: Production (Vercel)

Frontend: <https://acp-front-nu.vercel.app>

API: <https://acp-api-w2ng.onrender.com>

Browser: Chrome 146.0.7680.165

Date: 05.04.2026

Preconditions:

User opens the homepage

Application loads successfully

API requests are completed without errors

Steps to Reproduce:

Open the main page

Wait until the page fully loads

Start scrolling down the page

Observe the behavior of the header and underlying content

Actual Result:

Header overlaps the main content while scrolling

UI elements (e.g., forms, inputs, buttons) shift or become partially hidden
Some interactive elements may become inaccessible due to overlay.

Expected Result:

Header should remain properly positioned (fixed or sticky without overlap issues)

Page content should not shift or be covered

All UI elements should remain fully visible and accessible during scroll

Priority: Medium

Severity: Medium

Additional findings:

Issue is inconsistent depending on field state:

- Inactive fields (route, time) are overlapped by footer
- Active fields (date, passengers) are displayed correctly above footer

Reproducible on:

- Desktop small (1366x768)
- iPad Air (820x1180)

BUG-004: Profile data is not loaded after page refresh due to failed API request

Title:

Profile data is not loaded after page refresh (Failed to fetch error)

Environment:

Production (Vercel)

<https://acp-front-nu.vercel.app>

Browser: Chrome 146.0.7680.165

Device: Desktop / Mobile (DevTools)

Description:

Profile data fails to load after page refresh.

The UI shows "Failed to fetch" error and profile fields are empty.

The issue is intermittent:

- Sometimes profile loads correctly
- Sometimes API request fails after refresh

Steps to Reproduce:

1. Login to the application
2. Navigate to Profile page
3. Refresh the page (F5)
4. Observe profile loading

Actual Result:

"Failed to fetch" error is displayed

Profile data is not loaded

Network request to /users/profile fails or is blocked

Expected Result:

Profile data should load correctly after page refresh.

Priority: High

Severity: High

Additional info:

API works correctly via Postman (returns 200 OK with valid token)

Issue may be related to token handling or authorization on frontend

BUG-005: Language switch(UA/EN) is not displayed on iPad

Title:

Bug – Language switch icons are missing on iPad

Environment:

- Production (Vercel)
- URL: <https://acp-front-nu.vercel.app>
- Device: iPad (768x1024)
- Browser: Chrome DevTools (mobile emulation)
- OS: iOS (emulated)
- Zoom: 100%
- Date: 07.04.2026

Preconditions:

- User opens the homepage
- Page loads successfully

Steps to Reproduce:

1. Open the homepage
2. Enable device toolbar (Ctrl + Shift + M)
3. Select iPad (768x1024)
4. Observe the header

Actual Result:

- Language switch icons (UA / EN) are not displayed in the header

Expected Result:

- Language switch icons (UA / EN) are visible and accessible in the header

Priority: Medium

Severity: Medium (UI / functionality)

Notes:

- Language icons are visible on mobile and/or desktop resolutions
- Issue occurs only on iPad resolution

BUG-006: Login form is misaligned on iPad(layout broken)

Title:

Bug – Login form is misaligned on iPad (not centered)

Environment:

- Production (Vercel)
- URL: <https://acp-front-nu.vercel.app/login>
- Device: iPad (768x1024)
- Browser: Chrome DevTools (mobile emulation)
- Zoom: 100%
- Date: 07.04.2026

Preconditions:

- User opens the login page

Steps to Reproduce:

1. Open the login page
2. Enable device toolbar (Ctrl + Shift + M)
3. Select iPad (768x1024)
4. Observe the login form layout

Actual Result:

- Login form is not centered

- Form is aligned to the left side of the screen
- Layout looks broken and unbalanced
- Excess empty space on the right side

Expected Result:

- Login form should be centered on the screen
- Layout should be properly aligned and visually balanced
- UI should adapt correctly for tablet resolution

Priority: High

Severity: Medium (UI / UX issue)

Notes:

- Layout looks correct on mobile devices
- Issue appears only on tablet resolution (iPad)
- Likely related to incorrect responsive layout handling

BUG-007: Footer layout issues on Desktop

Title:

Bug – Footer layout issues on Desktop (1366x768): text clipping and insufficient spacing with page content

Environment:

- Production (Vercel)
- URL: <https://acp-front-nu.vercel.app>
- Device: Desktop Small (1366x768)
- Browser: Chrome DevTools (mobile emulation)
- Zoom: 100%
- Date: 07.04.2026

Preconditions:

- User opens the homepage
- Page loads successfully

Steps to Reproduce:

1. Open the homepage
2. Scroll down to the bottom of the page
3. Observe the footer section
4. Check the copyright text and spacing between content (map) and footer

Actual Result:

- Footer text is partially cut off at the bottom (e.g., last characters of the year are not fully visible)
- Insufficient spacing between page content and footer
- Map content (Google Maps labels) appears too close to the footer, causing visual crowding

Expected Result:

- Footer text should be fully visible without clipping
- Proper spacing (padding/margin) should be maintained between content and footer
- Layout should be visually balanced and readable

Priority: Low

Severity: Low (UI issue)

Notes:

- Issue reproducible on Desktop Small resolution (1366x768)
- Likely related to CSS (container height, overflow, or missing spacing)
- Multiple manifestations indicate a layout consistency issue in the footer section

BUG-008: Infinite repeated requests to /api/v1/trips endpoint on page load

Environment:

- Production: [VercelPassenger transportation and ticket booking | Autolux Cherkasy-Plus](#)
 - Browser: Chrome 146.0.7680.165
-

Preconditions:

- User opens the main page
-

Steps to reproduce:

1. Open the website
 2. Open DevTools (F12)
 3. Navigate to the **Network** tab
 4. Filter requests by `trips`
-

Actual result:

- Continuous requests are sent to `/api/v1/trips` without any user interaction
 - Number of requests rapidly increases (hundreds within seconds)
 - Status codes: `200 OK` and `304 Not Modified`
 - Requests continue indefinitely
-

Expected result:

- A single request (or limited number of requests) should be sent on page load
 - No repeated requests without user interaction unless intentional polling is implemented
-

Additional information:

- Issue occurs immediately after page load
- Requests are triggered even when response data does not change
- May indicate infinite re-render or incorrect dependency handling in frontend (e.g. `useEffect`)
- Can lead to performance degradation and unnecessary server load

****User impact:****

User cannot select route or time, booking flow is blocked

****UI note:****

Form remains in loading state ("Завантажуємо рейси..."), fields are disabled

Retest result:

The issue is no longer reproducible.

- No infinite API requests observed after page reload
- Requests to /api/v1/trips are stable (1–2 requests) and do not repeat continuously
- No increase in request count over time (no loop)
- Trips list loads correctly
- Route and time selection work as expected
- UI remains stable (no layout shift during loading)

Console:

- No critical errors observed
- Only non-blocking preload warnings present

Fix verified.
